INTRODUCTION

Vision-Language Models (VLMs) have demostrated impressive capabilities in Visual Question Answering (VQA), but they often fail to deal with the cases where the available visual information is not enough to answer a question. Our study focuses on a key question: can VLMs guide users on how to adjust an image when the information is incomplete? This ability is particularly important for helping visually impaired individuals.

CONTRIBUTION

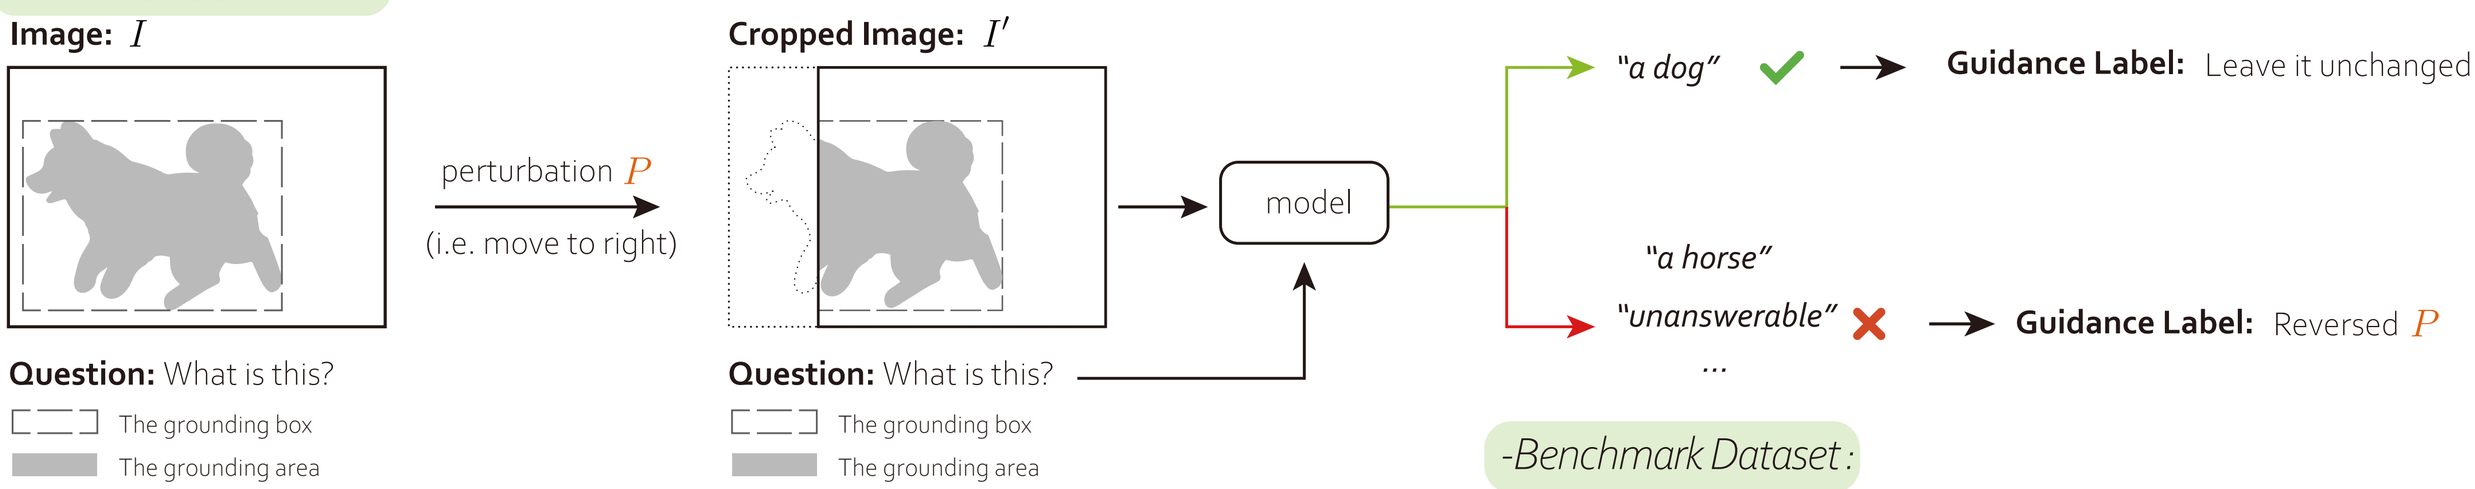

1. **Directional Guidance task**: we propose a novel VQA task which aims to provide actionable guidance to acquire the necessary details when the information is insufficient.

2. **Directional Guidance dataset**: We present a human-labeled test set to benchmark the Directional Guidance capability of existing VLMs.

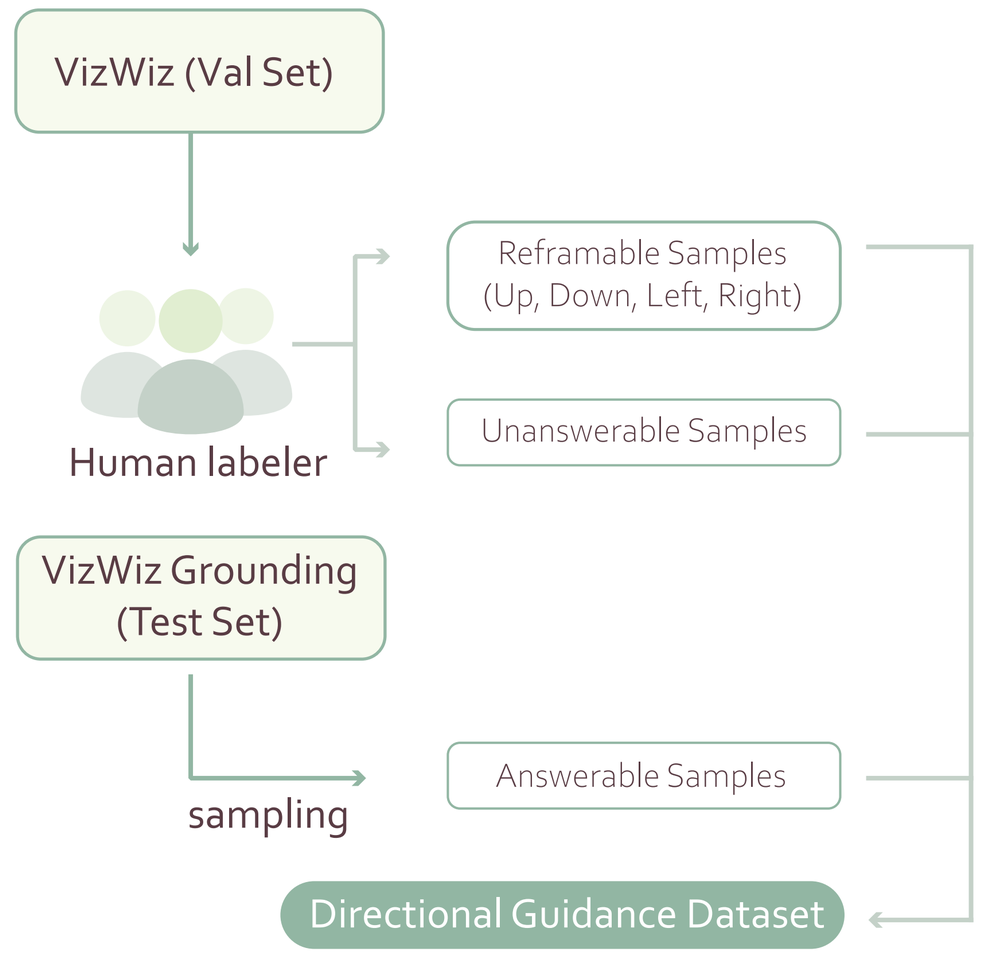

3. **Directional Guidance framework**: We introduce a data-efficient framework to generate training data for the proposed task. This flexible framework demonstrates generalizability and notable improvements with the mainstream VLMs.

METHOD

-Train Set Generation:

-Benchmark Dataset :

RESULTS
