Project page

TouchingSpace An audio-haptic map assistant, co-designed with a blind user [1, 5, 6]

Legend

1 Trackpad	2 Finger context	3 Haptic regions	4 Real map
Standard laptop trackpad, no extra device	Direction and distance to nearby places	A hum grows near a place, vibration marks its edge	Streets and buildings from OpenStreetMap

Q&A example

Reader **"What is this place?"**

Model "You are inside Parish Hall, a medium-sized rectangular building in the south of the map."

Participant quotes

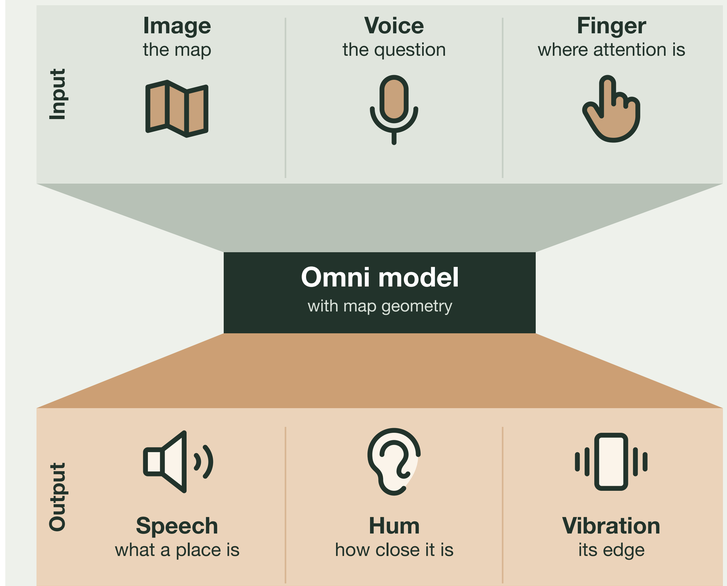

"I didn't know how to read a map, but now I can."

"No one tells you. [The mental map] could be that way forever."

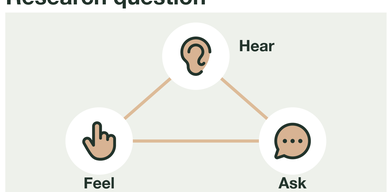

"I can tell someone sighted how to get somewhere now."

"I thought it would be hard for me to build a mental map, but I was able to kind of draw that L-shape or square shape of the streets."

Multimodal input and multisensory output

Research question

How can AI use different senses to convey information and enhance human perception?

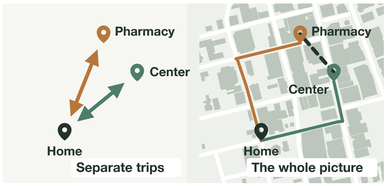

Sound, touch, and speech each reveal a different side of space, and each can verify the others [2, 3].

User feedback from 14 blind and low-vision readers

To know what to search

A search box only answers what you think to ask. Under the finger, readers met places they did not know to ask about.

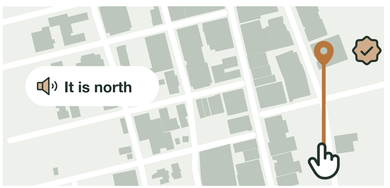

To make a plan

Step-by-step answers keep trips apart. The whole picture joins them [4]: one reader's pharmacy was five minutes from the center.

To build a picture

"I started getting a picture in my mind of where everything was."

To check what the AI says

Readers cross-checked one channel against the others, and against what they already knew.

Broader applications

Robotics	Share spatial awareness with people
Spatial AI	Test how models reason about space
Voice AI	Talk with AI just like reading a map
Wearables	Guide direction when eyes are busy
Search	Spark searches for the unknown

Future directions

Proactive adaptation. The model infers what a person has learned from video and touch, then adapts the map to gaps and errors they cannot see.

New senses. Translating sensor signals, such as infrared or magnetic fields, into touch.

Two-way learning. People correct the model through touch, as the model informs them.

Measuring information transfer. Which modalities work best together, and how much information survives each conversion.

Implementation and results

Voice	Interchangeable: commercial or open models, speech-to-speech or TTS
Model	Qwen3-Omni-30B-A3B Instruct, BF16 [7]
Device	1 NVIDIA A100, all three model stages on one GPU (default uses two)
Software	CUDA 13.0, CUDA Graphs, FlashAttention, vLLM-Omni
Memory	76.4 GiB used of 80 GB
Response	1.53 s median to first sound
Benchmark	Spoken questions on 3 real maps, scored against map geometry

Question category	n	Gemini 2.5 Flash Native Audio [8]	Qwen3-Omni
Direction and distance from the finger	89	98%	97%
Direction and distance between two places	56	43%	57%
Nearby places	52	73%	75%
Identity of a place	39	87%	85%
Attributes of a place	43	88%	93%
Region of the map	57	86%	77%
Whether a place exists	57	98%	98%
All	**393**	**83.0%**	**84.0%**
